

PARTICLES

talks to anything w/  $\gamma \neq 0$

talks to anything w/  
A or a index  
 $\uparrow$  UPPER/LOWER

$\gamma = -1/2$

$\gamma = 1$

3 PARTICLE RULES :

using  $f^{ABC} = \epsilon^{ABC}$   
to contract A indices  
 $g_{\mu\nu}, P_\mu$  to contract  $\mu$  indices.

using  $\delta_{ab}^c$  to contract SU(2)  
 $\dagger (\sigma^\mu)_{ab}$  to contract spin

$\uparrow$  using  $P_\mu$  to  
contract spin index

using  $(T^A)^a_b$   
to contract  
SU(2) indices

no b/c E has no SU(2) charge  
(no indices)

## YUKAWA COUPLING:

CONTRACTION OF INDICES / CONSERVATION OF CHARGE  
IN THE YUKAWA COUPLINGS:

SU(2):  $\delta^a_b$  contracts  $L^+ \frac{1}{2} H$  /  $L \frac{1}{2} H^+$

$$U(1) : \quad \begin{array}{c} \uparrow \\ H^+ \end{array} \quad \begin{array}{c} \uparrow \\ L \end{array} \quad \begin{array}{c} \uparrow \\ E^- \end{array} \quad -\frac{1}{2} - \frac{1}{2} + 1 = 0$$

$$\begin{array}{c} \uparrow \\ H \end{array} \quad \begin{array}{c} \uparrow \\ L^+ \end{array} \quad \begin{array}{c} \uparrow \\ E^+ \end{array} \quad \frac{1}{2} + \frac{1}{2} - 1 = 0$$

SPIN :  $\begin{array}{c} L^+ \frac{1}{2} E^+ \\ L \frac{1}{2} E \end{array}$  both have dotted indices  
undotted indices

contract these w/  $E \otimes \bar{b}$  or  $E \otimes b$ .
